CALCULATING QUANTITIES AND COST

The driveway is amazing!

To calculate an accurate estimate for your project, follow the information and instructions below for your driveway or project.

Below you will see two pictures that represent the level of density I use to calculate needed pounds of product for your project.

To figure the square footage for your project:

- Multiply the width of one side in feet times the length of one side of your driveway or space. This is your needed square footage.
- Divide your square feet by 16 (the level of coverage in the pictures below. This is your needed pounds.
- If you desire some or all of your areas to be more or less dense, figure accordingly.
- Example: 20'x40' driveway = 800 sq. ft. divided by 16 = $800/16 = 50$ lbs. = discount (Discounts start at 18 lbs. Contact us for the latest prices.)
